July 2009
Introduction

The accident statistics presented in this summary are confined to worldwide commercial jet airplanes that are heavier than 60,000 pounds maximum gross weight. Within that set of airplanes, there are two groups excluded:

1) Airplanes manufactured in the Commonwealth of Independent States (CIS) or the Union of Soviet Socialist Republics (USSR) are excluded because of the lack of operational data; and

2) Commercial airplanes operated in military service. (However, if a military-owned commercial jet transport is used for civilian commercial service, those data will be included in this summary.)

The following airplanes are included in the statistics:

| 717  | DC-8    | A300 | BAe 146 | F-28 | Concorde | L-1011 | BAC 1-11 | Comet 4 |
| 707/720 | DC-9    | A300-600 | Avro RJ-70/-85/-100 | F-70  | Trident  |
| 727  | DC-10/MD-10 | A310 | CRJ-700/-900 | F-100 | Caravelle |
| 737  | MD-11   | A320/321/319/318 | EMB-170/-175/-190 |
| 747  | MD-80/-90 | A330  |          |       | Mercure  |
| 757  |         | A340  |          |       | CV-880/-990 |
| 767  |         | A380  |          |       | VC-10    |
| 777  |         |       |          |       |          |

Flight operations data for Boeing airplanes are developed internally from airline operator reports. Flight operations data for non-Boeing airplanes are developed from two external sources, Client Aviation System Enquiry (CASE) published by Ascend, and AirCraft Analytical System (ACAS), published by The Flight Group.

Accident data are obtained, when available, from government accident reports. Otherwise, information is from operators, manufacturers, various government and private information services, and press accounts.

Definitions related to development of statistics in this summary are primarily based on corresponding International Civil Aviation Organization (ICAO), National Transportation Safety Board (NTSB), and Flight Safety Foundation (FSF) terms as explained in the next section.
Definitions

**Airplane Accident:** An occurrence associated with the operation of an airplane that takes place between the time any person boards the airplane with the intention of flight and such time as all such persons have disembarked, in which:

- Death or serious injury results from:
  - Being in the airplane; or
  - Direct contact with the airplane or anything attached thereto; or
  - Direct exposure to jet blast;

**Excluding:**
- Fatal and nonfatal injuries from natural causes; and
- Fatal and nonfatal self-inflicted injuries or injuries inflicted by other persons; and
- Fatal and nonfatal injuries of stowaways hiding outside the areas normally available to the passengers and crew; and
- Nonfatal injuries resulting from atmospheric turbulence, maneuvering, loose objects, boarding, disembarking, evacuation, and maintenance and servicing; and
- Nonfatal injuries to persons not aboard the airplane; or
- The airplane sustains substantial damage; or
- The airplane is missing or is completely inaccessible.

The following occurrences are not considered airplane accidents – those that are the result of experimental test flights or the result of a hostile action, including sabotage, hijacking, terrorism, and military action.

**Note:** This is generally consistent with the ICAO and the NTSB definition of an accident (see the Referenced ICAO and NTSB Definitions section). The differences are:

1) The ICAO and NTSB references to “aircraft” were changed to “airplane” and references to propellers and rotors were eliminated; and

2) This publication excludes events that result in nonfatal injuries from atmospheric turbulence, maneuvering, etc.; nonfatal injuries to persons not aboard the airplane; and any events that result from an experimental test flight or from hostile action, such as sabotage, hijacking, terrorism, and military action.

**Note:** Within this publication, the term “accident” is used interchangeably with “airplane accident.”
Definitions (continued)

**Destroyed:** The estimated or likely cost of repairs would have exceeded 50 percent of the new value of the airplane had it still been in production at the time of the accident.

*Note:* This definition is consistent with the FSF definition. The NTSB defines destroyed as damaged due to impact, fire, or in-flight failures to an extent not economically repairable.

**Fatal Injury:** Any injury that results in death within 30 days of the accident.

*Note:* This is consistent with both the ICAO and the NTSB definition.

**Major Accident:** An accident in which any of three conditions is met:

- The airplane was destroyed; or
- There were multiple fatalities; or
- There was one fatality and the airplane was substantially damaged.

*Note:* This definition is consistent with the NTSB definition. It is also generally consistent with FSF, except that FSF confines multiple fatalities to occupants. ICAO does not formally define the term major accident.

**Serious Injury:** An injury which is sustained by a person in an accident and which:

- Requires hospitalization for more than 48 hours, commencing within seven days from the date the injury was received; or
- Results in a fracture of any bone (except simple fractures of fingers, toes, or nose); or
- Involves lacerations which cause severe hemorrhage, nerve, muscle, or tendon damage; or
- Involves injury to any internal organ; or
- Involves second or third degree burns, or any burns affecting more than 5 percent of the body surface; or
- Involves verified exposure to infectious substances or injurious radiation.

*Note:* This is consistent with the ICAO definition. It is also consistent with the NTSB’s except for the last bullet item, which is not included in the NTSB definition.
Substantial Damage: Damage or failure which adversely affects the structural strength, performance, or flight characteristics of the airplane, and which would normally require major repair or replacement of the affected component. Substantial damage is not considered to be:

- Engine failure or damage limited to an engine if only one engine fails or is damaged
- Bent fairings or cowlings
- Dents in the skin
- Small puncture holes in the skin
- Damage to wheels
- Damage to tires
- Damage to flaps
- Damage to engine accessories
- Damage to brakes
- Damage to wingtips

Note 1. – This is generally consistent with the NTSB definition of substantial damage except: 1) It deletes reference to “puncture holes in the fabric” and “ground damage to rotor or propeller blades”; and 2) It deletes “damage to landing gear” from the list of items not considered to be substantial damage.

Note 2. – ICAO does not define the term substantial damage. Still, the above definition is generally consistent with the ICAO definition of structural damage contained within part b) of the ICAO accident definition.
Boeing Terms

The terms on this page were created by Boeing for this publication and do not have corresponding equivalents in ICAO, the NTSB, etc.

**Accident Rates:** In general, this expression is a measure of accidents per million departures. Departures (or flight cycles) are used as the basis for calculating rates, since there is a stronger statistical correlation between accidents and departures than there is between accidents and flight hours, or between accidents and the number of airplanes in service, or between accidents and passenger miles or freight miles. Airplane departures data are continually updated and revised as new information and estimating processes become available. These form the baseline for the measure of accident rates and, as a consequence, rates may vary between editions of this publication.

**Airplane Collisions:** Events involving two or more airplanes are counted as separate events, one for each airplane. For example, destruction of two airplanes in a collision is considered to be two separate accidents.

**Fatal Accident:** An accident that results in fatal injury.

**Hull Loss:** Airplane totally destroyed or damaged and not repaired. Hull loss also includes but is not limited to events in which:

- The airplane is missing; or
- The search for the wreckage has been terminated without it being located; or
- The airplane is completely inaccessible.

*Note: Neither ICAO nor the NTSB has a definition for hull loss.*
Exclusions

Certain airplanes and events are excluded from consideration as accidents in this summary. This is a complete list of those exclusions.

Excluded Airplanes
Airplanes manufactured in the Commonwealth of Independent States (CIS) or the Union of Soviet Socialist Republics (USSR) are excluded because of the lack of operational data. Commercial airplanes operated in military service are also excluded. (However, if a military-owned commercial jet transport is used for civilian commercial service, those data are included in this summary.)

Excluded Events
- Fatal and nonfatal injuries from natural causes;
- Fatal and nonfatal self-inflicted injuries or injuries inflicted by other persons;
- Fatal and nonfatal injuries of stowaways hiding outside the areas normally available to the passengers and crew;
- Nonfatal injuries resulting from atmospheric turbulence, maneuvering, loose objects, boarding, disembarking, evacuation, and maintenance and servicing;
- Nonfatal injuries to persons not aboard the airplane;
- Experimental test flights (However, maintenance test flights, ferry, positioning, training, and demonstration flights are not excluded events.);
- Sabotage, hijacking, terrorism, and military action.
Referenced ICAO and NTSB Definitions

International Civil Aviation Organization (ICAO) and the National Transportation Safety Board (NTSB) definitions are included below for reference.

Accident

ICAO defines an accident as follows:

An occurrence associated with the operation of an aircraft which takes place between the time any person boards the aircraft with the intention of flight until such time as all such persons have disembarked, in which:

a) a person is fatally or seriously injured as a result of:
   • Being in the aircraft, or
   • Direct contact with any part of the aircraft, including parts which have become detached from the aircraft, or
   • Direct exposure to jet blast,
   except when the injuries are from natural causes, self-inflicted or inflicted by other persons, or when the injuries are to stowaways hiding outside the areas normally available to the passengers and crew; or
b) the aircraft sustains damage or structural failure which:
   • Adversely affects the structural strength, performance, or flight characteristics of the aircraft, and
   • Would normally require major repair or replacement of the affected component,
   except for engine failure or damage, when the damage is limited to the engine, its cowlings or accessories; or for damage limited to propellers, wing tips, antennas, tires, brakes, fairings, small dents or puncture holes in the aircraft skin; or
   c) The aircraft is missing or is completely inaccessible.

The NTSB defines an aircraft accident as follows:

Aircraft accident means an occurrence associated with the operation of an aircraft which takes place between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death or serious injury, or in which the aircraft receives substantial damage.
Serious Injury

ICAO defines **serious injury** as follows:

An injury which is sustained by a person in an accident and which:

a) Requires hospitalization for more than 48 hours, commencing within seven days from the date the injury was received; or
b) Results in a fracture of any bone (except simple fractures of fingers, toes, or nose); or
c) Involves lacerations which cause severe hemorrhage, nerve, muscle, or tendon damage; or
d) Involves injury to any internal organ; or
e) Involves second or third degree burns, or any burns affecting more than 5 percent of the body surface; or
f) Involves verified exposure to infectious substances or injurious radiation.

The NTSB defines **serious injury** as follows:

Serious injury means any injury which:

1) Requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received;  
2) Results in a fracture of any bone (except simple fractures of fingers, toes, or nose);  
3) Causes severe hemorrhages, nerve, muscle, or tendon damage;  
4) Involves any internal organ; or  
5) Involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

Substantial Damage

The NTSB defines **substantial damage** as follows:

Damage or failure that adversely affects the structural strength, performance, or flight characteristics of the aircraft, and that would normally require major repair or replacement of the affected component. Engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairings or cowling, dented skin, small puncture holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wingtips are not considered "substantial damage."

ICAO does not define the term **substantial damage**.

| 53 | Total Accidents | 26 | 356 Onboard (41) External | 17 |
Departures, Flight Hours, and Jet Airplanes in Service*

- 541.9 million departures since 1959 (421.7 million on Boeing airplanes)
- 947.2 million flight hours since 1959 (742.3 million on Boeing airplanes)
- There were 37 (16 Boeing) significant types built by 16 original manufacturers that contributed to the hours, departures, and fleet numbers. There are currently four manufacturers of large commercial Western-built jet airplanes.

* Certified jet airplanes greater than 60,000 pounds maximum gross weight, including those in temporary non-flying status and those in use by non-airline operators. Excluded are commercial airplanes operated in military service and CIS/USSR-manufactured airplanes.

- Final approach: 3%
- Landing: 12%

**Exposure**
- (Percentage of flight time estimated for a 1.5 hour flight)
  - Taxi, load/unload parked, tow: 1%
  - Takeoff: 1%
  - Initial climb: 14%
  - Climb (flaps up): 57%
  - Descent: 11%
  - Initial approach: 12%
  - Final approach: 3%
  - Landing: 1%

Percentages may not sum to 100% due to numerical rounding.

Distribution of fatal accidents and onboard fatalities

---

2008 STATISTICAL SUMMARY, JULY 2009
Fatalities by CAST/ICAO Common Taxonomy Team (CICTT)
Aviation Occurrence Categories

Fatalities

- External fatalities [Total 253]
- Onboard fatalities [Total 4717]

No accidents were noted in the following principal categories:
- ADRM Aerodrome
- AMAN Abrupt Maneuver
- ATM Air Traffic Management/Communications, Navigation, Surveillance
- CABIN Cabin Safety Events
- EVAC Evacuation
- F-POST Fire/Smoke (Post-Impact)
- GCOL Ground Collision
- ICE Icing
- LALT Low Altitude Operations
- RI-A Runway Incursion – Animal
- SEC Security Related
- TURB Turbulence Encounter

For a complete description go to:
http://www.intlaviationstandards.org/

Note: Principal categories as assigned by CAST.
CAST/ICAO Common Taxonomy Team (CICTT)
Aviation Occurrence Categories

The International Civil Aviation Organization (ICAO) and the Commercial Aviation Safety Team (CAST), which includes Government officials and aviation industry leaders, have jointly chartered the CAST/ICAO Common Taxonomy Team (CICTT). CICTT includes experts from several air carriers, aircraft manufacturers, engine manufacturers, pilot associations, regulatory authorities, transportation safety boards, ICAO, and members from Canada, the European Union, France, Italy, the Netherlands, the United Kingdom, and the United States. CICTT is co-chaired by a representative from ICAO and CAST.

The team is charged with developing common taxonomies and definitions for aviation accident and incident reporting systems. Common taxonomies and definitions establish a standard industry language, thereby improving the quality of information and communication. With this common language, the aviation community’s capacity to focus on common safety issues is greatly enhanced.

The CICTT Aviation Occurrence Taxonomy is designed to permit the assignment of multiple categories as necessary to describe the accident or incident. Since 2001, the Safety Indicator Steering Group (SISG) has met annually to assign CICTT occurrence categories to the prior year’s accidents.

In a separate activity, the CAST assigned each accident to a single principal category. Those accident assignments and a brief description of the categories are reported in the preceding chart.

The CAST use of principal categories has been instrumental in focusing industry and government efforts and resources on accident prevention. Pareto charts using principal categories are used by CAST to identify changes to historic risk and to help to determine if the safety enhancements put in place are effective.

For a complete description of the categories go to: http://www.intlaviationstandards.org/
